Uncrate/remove systems, panels, and accessories from pallet and check packing list. READ ALL MANUALS/DOCUMENTS!

Roll or transport system to the location where power is desired.

Open solar panel box on flat surface. The two panels are hinged like a book with new pig tail cable that plugs into the longer cable ordered, and longer cable plugs directly into the SOLAR portal.

If a second pair of panels was ordered, their box will be marked as containing two panels and an external charge controller.

Place panels in direct sun with cable in range of Godman GRID. Plug panels into small red SOLAR portal on DC end. Check that at least one colored LED light on the left side of charge controller is lit.

For second pair, connect panels' red plug to shorter cable of external charge controller marked PV, then connect controller's longer cable marked AUX to the small red AUX portal on Godman GRID's DC end.

Toggle the 3-position master switch on right of charge controller down to read LED display of battery voltage status.

Ensure devices you wish to power are off and plug them into inverter outlets on AC end. **Flip the large master switch up to ON, turn the inverter switch ON, and turn on desired devices!**

DC End (Charge Controller on left.)

AC End (Inverter - switch is on left.)

External Controller
